

SYNERGY TELECOM PVT. LTD

(Anritsu MS710I 23 GHz Spectrum Analyzer)

The MS710 Series Spectrum Analyzers are high-performance instruments that incorporate various advanced microwave and digital technologies using micro-processor. These spectrum analyzers are used for measuring a wide range of low to extremely high frequencies.

The major applications of this series include multiple testing for the development and production of high-frequency devices and components, analyzing spurious signals and spectrum distribution and the modulation characteristics of radio equipment, and monitoring spectrum and interference wave measurements at microwave radio stations (ground and satellite stations).
